**DELIVERY OF SEEDS.** The prices listed include free delivery of all Vegetable and Flower Seeds when cash accompanies the order, except such varieties as are priced at a 100 lb. rate. Orders priced at this rate for Vegetable Seeds, Peas, Beans, Sweet Corn, Lawn Grass, Grass Seeds and such heavy and unmailable goods as Field Corn, Roots, Seed Potatoes, Insecticides and Fertilizers will be shipped by Truck, Freight or Express, charges to be collected from the customer. If this class of goods must be shipped by parcel post please include postage with order.

**TERMS OF SALE.** Our regular terms are CASH WITH ORDER. Remittance by Bank Check, Post Office or Express Money Order is safest. Register letters containing money. Please do not ask for C.O.D. shipment unless you enclose 25% of the amount of the order.

In conformity with other responsible seedsmen, Comstock, Ferre & Co. warrants to the extent of the purchase price that seeds, bulbs or plants sold are as described on the container within recognized tolerances. Seller gives no other or further warranty, express or implied.

**SPECIAL QUOTATIONS.** Prices, particularly of Field Seeds, depend upon market conditions and are subject to change without notice. We will quote large quantities at prices as low as the highest quality of seed will permit. Let us quote you current prices on Grass and Field Seeds, Seed Potatoes and Onion Sets.

**SEED TREATMENT.** The treatment of seeds before planting is good insurance against loss and poor stands due to unfavorable weather and soil conditions. The so called failure of seeds to germinate is more often due to outside influences than any fault in the seeds themselves. The most effective materials we have found for seed treatment for good general use are Spergon and Phygon. These are particularly effective on Beans, Beet, Corn, Spinach and Squash and beneficial to a lesser degree on many other seeds. It is important that the right amount of the right material be used or germination may be retarded.

We recommend that our customers use these materials only with the most recent instructions of manufacturers and Experiment Station authorities. Upon request we can furnish seed on bulk orders treated as required at a slight advance in price, but we do not guarantee or hold ourselves responsible for results.

**MAIL ORDERS.** In the shipping season we endeavor to give prompt service on orders, and give special attention to seeds needed for immediate planting. During the rush season some delay is inevitable as we are called upon to supply an ever increasing number of orders in spite of being hampered by uncertain and slow delivery of our seed supplies. Early orders are advisable, particularly for seed to be sown in greenhouses and cold frames for growing early plants. Very early orders for general garden planting may have to be held for economical handling until crops of seed are received and packaged.

**CONNECTICUT SALES AND USE TAX.** Residents of Connecticut are liable for and we must collect a tax of 3½% upon a few items, such as Plant Labels, Twines, Paper Pots and feed for pets, such as Dog Feed and Bird Feeds.

**BEFORE MAILING YOUR ORDER.** Write your name, address and shipping point in full and plainly on the order sheet. Be sure to give nearest freight or express station if different from your post office address.

We will gladly send copies of this catalogue to any of your friends who may be interested.

High Quality Seed Produces Fine Lawns

## LAWN GRASS MIXTURES

The quality of a lawn depends as much upon the kind of seed sown as the care in preparation of the soil. Our mixtures are carefully planned, each to meet some particular condition of soil or use. The grasses used are selected for such high purity and germination with a negligible content of weed seeds and waste that each pound is sufficient to sow 200 sq. ft. or more. The gold and blue seal grades do not contain White Dutch Clover. If wanted this may be purchased separately and added. We will be glad to advise you as to special mixtures for any unusual conditions. Grass varieties are listed on page 43. Add postage for quantities of 5 lbs. or more.

## Pole or Running Beans

Pole beans, although they require the support of strong poles or a trellis, amply repay this extra attention. Chemically treated seed helps germination in cold wet soil and prevents damage by insects and disease. We use the most improved materials. On the most used varieties we can supply seed sorted into flat and thick kernels. The flat kernels are more uniform size and are recommended for use in corn planters, while the thicker kernels are equally good for smaller plantings.

# SWEET CORN

Sweet Corn is tender and will not stand frost, nor will it germinate well in wet cold soils. It responds to good soil and clean, frequent shallow cultivation. Plant in well fertilized hills 3 feet apart each way, putting 5 or 6 kernels in each hill and covering to a depth of not more than 1½ inches. When 6 inches high remove all but the 3 most vigorous stalks from each hill. For a succession throughout the season plant several varieties early in May, including first early to late varieties. A good main crop variety planted at intervals of two weeks until the middle of July will produce a continuous supply. Treatment with Spergon is very effective in insuring the germination, especially for early plantings, and controls seed borne diseases. For prices of Spergon see page 44.

# PEAS

Peas should be sown as early as possible in order to mature before the hot summer weather. To secure an extra early crop the smooth seeded varieties may be sown just as soon as the ground can be worked. The wrinkled varieties are not quite as hardy and should be planted a little later. Sow 2 or 3 inches deep in single or double rows 3 to 4 feet apart. The tall growing sorts require brush or other support. This is not so necessary for the dwarf varieties but they are greatly benefited if kept off the ground. Inoculation of the seed before planting with Nodogen increases the crop and enriches the soil.

## SPINACH

The most important greens crop. It is very hardy and will stand considerable freezing weather, but many varieties run to seed rapidly in hot weather. It is of easy culture and by successional sowing a supply may be secured throughout the season. For early spring use sow late in September and protect with hay or straw through the winter. May be sown in spring as early as the ground can be worked, either in rows or broadcast. Summer sowings should be on freshly plowed ground and the soil must be packed hard about the seed, as it will not germinate in dry soil.

Spinach seed treated with PHYGON germinates more evenly with a better stand.

# SQUASH

Warm and highly manured soil is required for the most successful culture of Squash. The summer kinds, nearly all of which are bush growth, should be planted in hills 4 feet apart each way, while the winter and other running varieties require 8 to 10 feet. When thinning, leave only 3 or 4 plants to a hill. Dusting with Rotenone dust is effective to control the Striped Cucumber Beetle.

# TOMATO

To furnish desirable early plants the seed should be sown in February or March in a hotbed or box kept in a warm place. When the plants are about 2 inches high they should be thinned or transplanted to ensure stocky plants. As soon as danger from frost is past transplant to the open ground, setting about 3 feet apart each way. They should be frequently cultivated and well-fertilized. The fruit will ripen earlier and be improved in quality if the vines are pruned to two stems and trained to stakes or trellises. Plants for late summer crop may be started from seed in May.

## HYBRID VARIETIES

## ANNUALS

### Flowers That Bloom the First Year From Seed

The best of success with many annuals may be had by sowing them in beds where they are to flower. The hardier varieties such as Calendula, Larkspur, Centaurea and Poppy may be sown very early, while the more tender, as Balsam, Nasturtium, Marigold and Zinnia, are best planted later when the ground has become warm. Prepare the soil carefully, making it soft and fine, and sow the seed broadcast or in rows. When large enough, thin the seedlings so that they stand about half as far apart as their maximum height. If a hotbed or coldframe is available many kinds may be started earlier and transplanted, hastening the blooming period. Perennials listed on page 38.

Biennials bloom at their best, for one season only, from seed sown the previous year.

Perennials bloom for several years, ordinarily attaining satisfactory flowering size the second year. Most perennials are best sown in June so that the seedlings will be ready for transplanting after the heat of the summer is over.

A bed or coldframe where some protection from the sun can be given is best. Some kinds flower the first season and will be found listed as annuals.

CORNELL 29-3

## GRAIN AND ENSILAGE CORNS

### Ensilage Varieties

Later, leafier varieties producing heavy tonnage of ensilage per acre. Many will yield heavy crops of ears if planted early and spaced thinly for each stalk to develop. The hybrid varieties have strong root systems and usually outyield the open-pollinated kinds.

**SWEEPSTAKES, WESTBRANCH (Red)**, 110 days. Earliest true ensilage corn which produces mature ears in this climate.

**YELLOW SWEEPSTAKES**, 110 days. Immense leafy stalks usually ready for cutting a few days later than Westbranch. Ears are large and long with very broad yellow kernels.

**PENNA. 602 (Hybrid)** 100 days. Early husking and ensilage variety. Ears and stalk medium to large, strong stalked, resistant to many diseases, a very dependable corn for general use.

**IOWA 4059 (Hybrid)** 115 days Strong stalked, leafy and vigorous, in many respects similar to U.S. #13, but slightly earlier.

**U. S. #13, (Hybrid)**, 120 days. Outstanding for strong stalks and well braced root system enabling the corn to withstand heavy rain and wind. Reliable for grain as well as ensilage.

**CONN. 870**, 120 days. Improved variety from the Conn. Agricultural Station. A heavy producer adapted to New England conditions, similar in growth and season to U. S. #13.

WETHERSFIELD, CONN.

### Grain Varieties

**CORNELL 35.5 HYBRID**, 95 days. Very early yellow dent with narrow kernels, particularly valued where there is a short growing season.

**YELLOW CANADA**, 100 days. Sometimes called 90-day yellow. The common 8-rowed flint corn of New England. Our strain produces particularly fine crops with large uniform ears.

**CORNELL 29.3 HYBRID**, 100 days. Vigorous heavy-leaved strain with a high yield of yellow dent ears tinged with red. Matures with Yellow Canada, but is leafier

**CORNELL M4** 100 days Vigorous early yellow dent. In the colder more northern sections this new hybrid can be depended upon for a well matured heavy crop of grain. Stalks leafy and strong, makes good ensilage.

**OHIO M15** 110 days. Standard yellow dent grain corn. Outstanding for yield. Ears are good size with deep kernels.

All of the above will be supplied at Market Prices

Most of the hybrid varieties are treated with approved fungicides to assure the best possible stands. The seed is also sized for more even planting.

Where crows and other birds pull corn we recommend the use of Reliance Crown Repellent. This may be used with fungicides and does not clog the planter.
